## Executive Summary

The project objective was to evaluate the current pavement condition of the City of Des Plaines (City) roadways and alleys and determine future maintenance and repair (M&R) needs for the City streets.

The primary tasks of this project included:

1. Verifying the City road and alley inventory and attributes;
2. Updating the Geodatabase and Geospatial Inventory using ARCGIS;
3. Performing a pavement condition field survey to determine the current condition of roadways;
4. Estimating the future 5-year maintenance and repair funding needs;
5. Providing a 5-year Capital Improvement Plan (CIP) that can be used to assist Engineers and Planners in assessing, prioritizing, and justifying pavement M&R needs.

The field survey, conducted in April 2019, identified 777 discrete roadway sections and 101 alleyways covering approximately 22 million square feet of pavement area and approximately 318 lane miles.

Results of the pavement condition survey showed that the **network-level area weighted average Pavement Condition Index (PCI) in 2019 was 62 (Fair)**, with approximately 61% of pavements in Fair or better condition and 39% of pavements in Poor, Very Poor or Failed condition.

Utilizing the condition results from the field inspections, future 5-year budget analysis forecasts were performed for different budget scenarios. A detailed description of the budget scenarios that were evaluated to develop the optimal 5-Year Capital Improvement Program (CIP) is presented in Chapter 4 of the report. A summary of the 5-year CIP by Work Type is presented in Table ES-1.

**Table ES-1 Estimated Recommended Five (5) Year CIP Cost**

Year	Work Type			Total Funding Cost	CIP Lane Miles
	Mill-and-Overlay Cost	Complete Reconstruction Cost	Selective Slab Replacement Cost		
2020	\$3,014,284	\$0	\$0	\$3,014,284	8
2021	\$13,093,756	\$1,088,813	\$6,777	\$14,589,122	36
2022	\$11,246,976	\$3,431,841	\$0	\$14,678,817	33
2023	\$12,636,520	\$2,066,759	\$10,652	\$14,713,931	21
2024	\$2,830,620	\$11,801,599	\$0	\$14,632,219	13
<b>Total</b>	<b>\$42,822,156</b>	<b>\$18,389,012</b>	<b>\$17,429</b>	<b>\$61,228,597</b>	<b>111</b>

## 1.0 Introduction

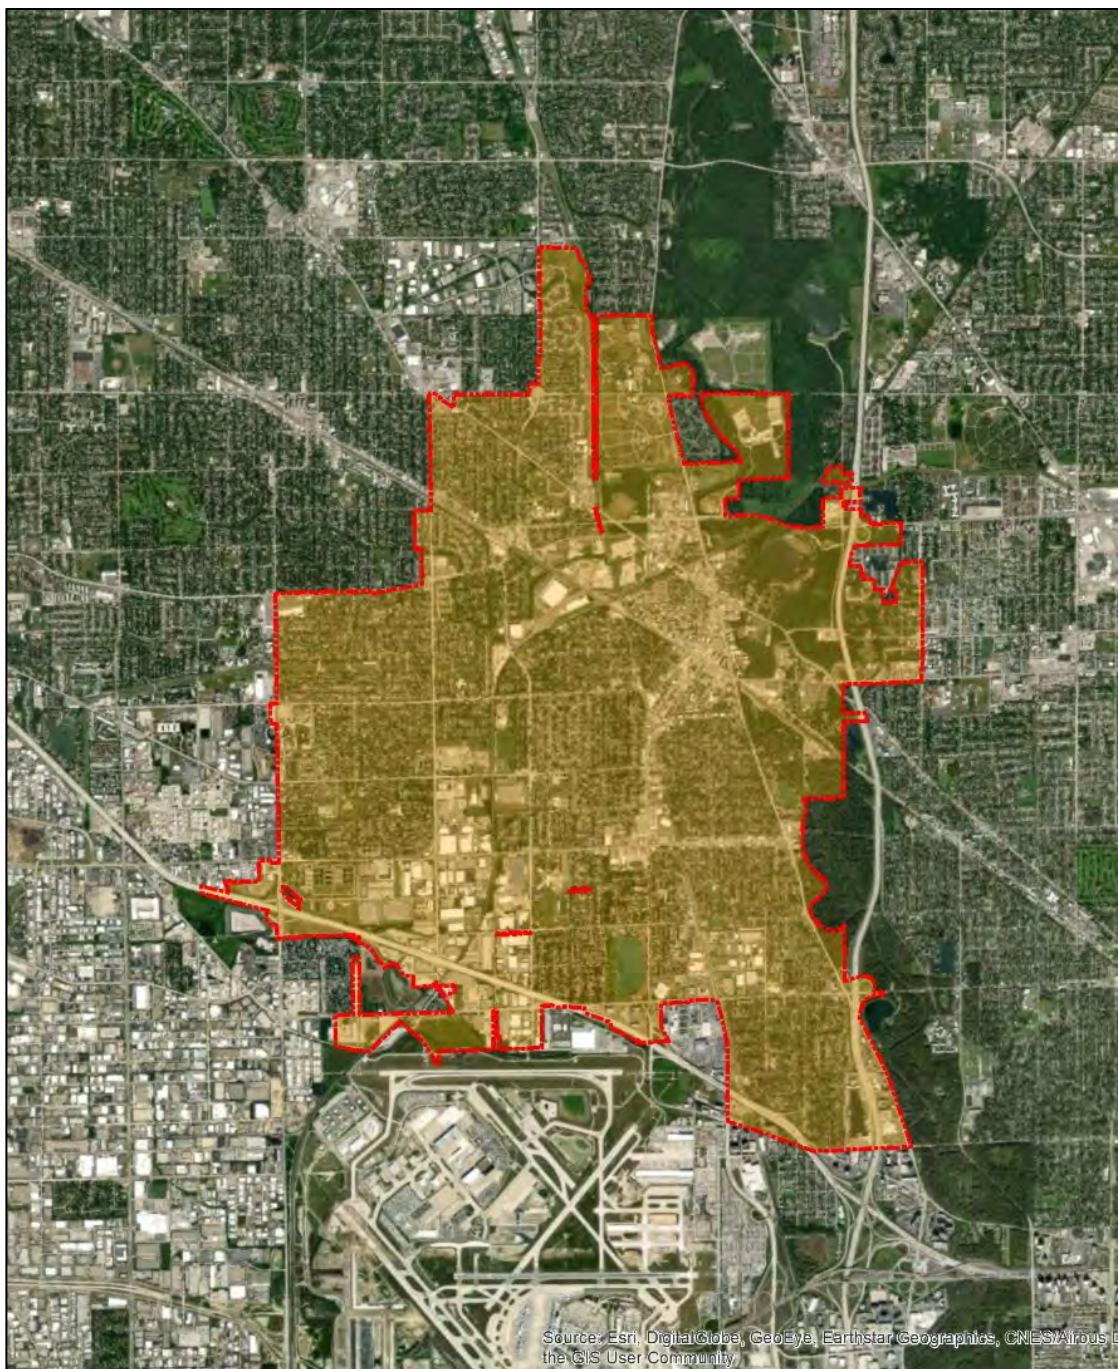

### 1.1 Background

The City of Des Plaines (City) retained AECOM to perform pavement management services for the roadway and alleyway network owned and maintained by the City. These tasks included: verifying pavement inventory, conducting a comprehensive high-speed vehicle-based pavement condition survey to assess existing conditions, and developing long-term and short-term pavement repair needs. Traditionally, the City has utilized a worst-first approach to maintain the roadway network but now desires establishment of a pavement maintenance and repair program that utilizes the pavement management methodology to provide a more strategic and cost-effective approach.

### 1.2 Project Scope and Objectives

The scope of the project only included the roads and alleys owned and maintained by the City of Des Plaines (Figure 1-1). The main objectives of this project were to identify pavement deficiencies within the network, and to recommend feasible capital improvement projects as well as localized maintenance needs. These objectives were achieved by completing the inventory setup, performing a pavement condition survey, and assessing pavement repair needs. The AECOM Team conducted a pavement condition survey utilizing modified Pavement Condition Index (PCI) approach based on ASTM D6433 “Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys.” Through this survey, specific pavement distresses were documented and then imported to the pavement management software, PAVER™. This software was utilized to evaluate current and future roadway conditions, and budgetary requirements. Several 5-years funding scenarios are presented within this report for comparison and potential consideration by the City.

## 2.0 Pavement Condition Survey - Process and Methodology

### 2.1 Introduction

This chapter introduces the objectives of pavement management system (PMS) and presents the process of the pavement condition index (PCI) as utilized in the field survey effort for the City.

### 2.2 Pavement Management Background

Growing needs for effective pavement asset management are often coupled with diminishing budgets, placing even greater emphasis on effective and timely decision-making with regard to treatment selection and application. Pavement management systems (PMS) have arisen out of this need and represent the process of monitoring, maintaining, and repairing a pavement network to provide maximum user benefits given available funds.

A PMS is a set of tools or methods that assists decision makers in finding optimum strategies for providing and maintaining pavements in a serviceable condition over a given time. PAVER™ is widely recognized as an industry-wide software for integrating PCI results into work planning. Analysis using the PAVER™ PMS software assists the decision-making process and prioritization of maintenance and repair activities.

The use of a pavement management system is intended to provide municipal agencies with a systematic process for cost-effectively managing their pavement network, which may include roadways, parking lots, and alleys.

Conducting PCI surveys are essential to support PMS implementation. Given the PCI score of a pavement section, a maintenance treatment is assigned. Costlier treatments are assigned to sections with lower PCI values. An objective metric like PCI allows City of Des Plaines personnel to conduct planning scenarios to assess the impacts of varying levels of funding. In running these scenarios, pavement sections are prioritized based on several user-selected criteria to develop a work plan that includes recommended annual maintenance activities and treatments.

### 2.3 Network Definition and Pavement Inventory

A key element in establishing the PMS is defining the pavement network and creating the inventory. Network definition is the process of dividing a pavement system into a hierarchical order that facilitates inspection and maintenance planning. The pavement inventory includes information that defines management sections with location, limits, size, and functional classification. The typical steps to create a network inventory per PAVER™ and ASTM D6433 definition include:

1. Establishing the limits of all pavement areas to be included in the **Network**. The network usually consists of pavement area within a specific facility layout that will be managed by the system. Typically, a municipality, city or village is designated a separate network. Each network is assigned a Network ID.
2. Divide the network into **Branches**. A branch is a readily-identifiable part of the pavement network having a distinct function/use. In this instance, roadways and alleyways were assigned as separate branches. Each branch is assigned a Branch ID.
3. Divide branches into **Sections**. A section is the smallest management unit when considering the application and selection of maintenance and repair treatments. A Section ID is assigned to a pavement area that exhibits a common age, surface type, construction type, traffic pattern, etc.
4. Establish the section hierarchy based on the relative importance of a specific section within the network. This is defined as **Rank**. Ranking is typically assigned based on pavement use, traffic type and volume, the ranks for pavements within the Des Plaines network are shown in Table 2-1.

5. This data is entered in a geographical information system (GIS) database as well as into a pavement management system (PMS) database, in this case, PAVER™.
6. Per ASTM D6433 standard, for inspection purposes, sections are divided into smaller features known as sample units. Sample units are small areas of the section that are defined as approximately every 200 ft of the section.

**Table 2-1: Pavement Rank within the Des Plaines Network**

Section Rank	Description	Priority
A	Principal	High
B	Arterial	High
C	Collector	Medium
E	Residential	Low
O	Alley	Low

## 2.4 PCI Background

Originally developed by the United States Army Corps of Engineers (USACE) and standardized by the American Society of Testing and Materials (ASTM), the PCI method relies on visual observation of the pavement surface to identify distresses and quantify their extent and severity. Combining distress types, quantities, and severity levels leads to the development of a PCI value that ranges from 100 to 0. A PCI value of 100 represents a pavement in perfectly good condition, while a value of 0 represents a pavement in a completely failed condition. The full range of conditions is presented in Table 2-2 which shows both a three-color and seven-color rating system. The 7-color category scheme is used consistently throughout this report.

**Table 2-2: Pavement Condition Index (PCI) Rating Scale**

Simplified Definition	Simplified PCI Color Legend	Full PCI Color Legend	PCI Range	PCI Ratings and Definition
GOOD			86 - 100	<u>GOOD</u> : Pavement has minor or no distresses and should require only routine maintenance.
			71 - 85	<u>SATISFACTORY</u> : Pavement has scattered low-severity distresses that should require only routine maintenance.
FAIR			56 - 70	<u>FAIR</u> : Pavement has a combination of generally low- and medium-severity distresses. Near-term maintenance and repair needs may range from routine to major.
POOR			41 - 55	<u>POOR</u> : Pavement has low-, medium-, and high-severity distresses that probably cause some operational problems. Near-term M&R needs ranges from routine to major.
			26 - 40	<u>VERY POOR</u> : Pavement has predominantly medium- and high-severity distresses that cause considerable maintenance and operational problems. Near-term M&R needs will be major.
			11 - 25	<u>SERIOUS</u> : Pavement has mainly high-severity distresses that cause operational restrictions. Immediate repairs are needed.
			0 - 10	<u>FAILED</u> : Pavement deterioration has progressed to the point that safe operations are no longer possible. Complete reconstruction is required.

Source: ASTM D6433 – Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys

The purpose of the PCI survey and pavement management in general is to identify and document pavement distresses caused by a variety of factors. This information can be used to:

- Determine a pavement's operational condition or level of service.
- Predict future pavement conditions based on family deterioration models.
- Develop and prioritize sustainment, repair, and restoration or modernization projects.
- Justify budget needs.

Table 2-3 and Table 2-4 lists distresses for AC and PCC pavements, as defined by ASTM D6433, *Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys*. Most of these distress types have corresponding severity levels of Low, Medium, and High, as defined in ASTM D6433. Identification of distress type and severity, combined with measurement of the specified distress, is performed by the field team and documented for the particular pavement segment. The combination of distress type, severity, and quantity result in a PCI deduct value, which reduces the overall PCI score with each deduct. These PCI deduct values are shown as a series of nomographs in ASTM D6433.

Distresses have different causes that result in the defect being observed at the pavement surface. The three categories of distress causes are load, climate or other. Load related distress types include distresses as a result of traffic loading (heavy traffic weights) and/or traffic volumes (high number of wheel repetitions). Climate related distresses are typically associated with factors such as freeze – thaw, heating – cooling, and wet - dry cycles. 'Other' related factors may include construction and/or material related defects. In general, distresses caused by structural loading may result in greater PCI deducts than climate-related or other issues, and thus a lower PCI score.

**Table 2-3: AC Pavement Distress Types**

<b>Code</b>	<b>Distress</b>	<b>Cause</b>
01	Alligator Cracking	Load
02	Bleeding	Other
03	Block Cracking	Climate/Durability
04	Bumps and Sags	Other
05	Corrugation	Other
06	Depression	Other
07	Edge Cracking	Load
08	Joint Reflection Cracking	Climate/Durability
09	Lane/Shoulder Drop-Off	Other
10	Longitudinal and Transverse Cracking	Climate/Durability
11	Patching and Utility Cut Patching	Other
12	Polished Aggregates	Other
13	Pothole	Load
14	Railroad Crossing	Other
15	Rutting	Load
16	Shoving	Other
17	Slippage Cracking	Other
18	Swell	Other
19	Raveling	Other
20	Weathering	Climate/Durability

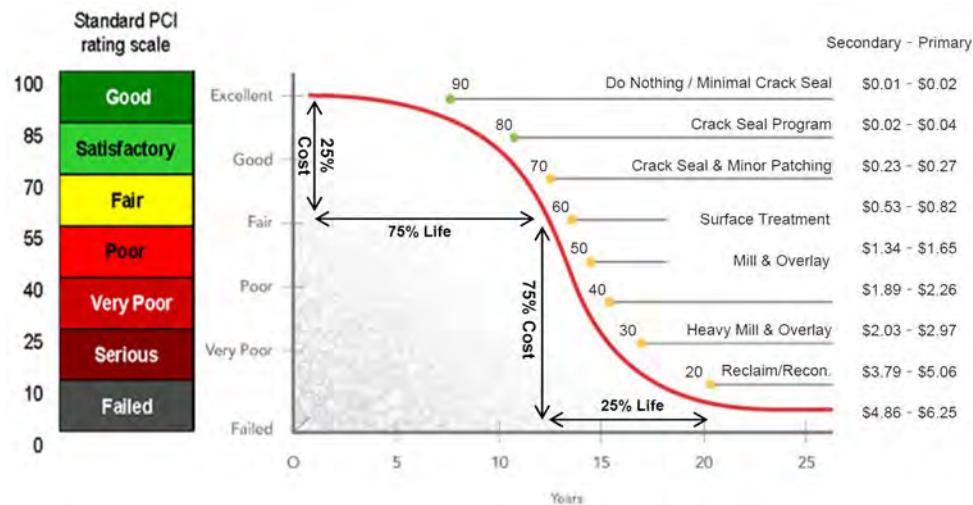

**Table 2-4: PCC Pavement Distress Types**

<b>Code</b>	<b>Distress</b>	<b>Cause</b>
21	Blowup/Buckling	Climate/Durability
22	Corner Break	Load
23	Divided Slab	Load
24	Durability ("D") Cracking	Climate/Durability
25	Faulting	Other
26	Joint Seal Damage	Climate/Durability
27	Lane/Shoulder Drop-Off	Other

Code	Distress	Cause
28	Linear Cracking	Load
29	Patching, Large and Utility Cuts	Other
30	Patching, Small	Other
31	Polished Aggregate	Other
32	Pop-outs	Other
33	Pumping	Other
34	Punchout	Load
35	Railroad Crossing	Other
36	Scaling, Map Cracking, and Crazing	Other
37	Shrinkage Cracks	Climate/Durability
38	Spalling, Corner	Climate/Durability
39	Spalling, Joint	Climate/Durability

Pavements deteriorate over time as traffic, environmental factors, and drainage considerations undermine the integrity of the pavement structure and underlying layers. While several factors influence the pavement deterioration rate, it is generally accepted that pavement deterioration follows an S-shaped curve as shown in Figure 2-1. With the PCI scale superimposed on this time-condition plot, it can be observed that deterioration rates level off initially in the Satisfactory to Fair range before dropping rapidly to the Fair to Poor range. While perhaps counter-intuitive, a worst-first strategy that prioritizes costlier reconstruction projects over treating pavement sections with less severe maintenance and rehabilitation (M&R) treatments may not result in the most efficient allocation of funds. As Figure 2-1 shows, delaying maintenance and repair activities until the pavement achieves a Poor to Failed condition category is more expensive than proactive M&R treatment applications that keep the pavement in Fair or better condition. A paradigm shift to proactive M&R treatment approaches from a reactive M&R approach remains a challenging but worthwhile goal.

**Figure 2-1: Standard PCI Rating Scale and Corresponding M&R Activities**

(Note: Prices shown are for illustrative purposes only)

## 2.5 Survey Process

In pavement management practices, a roadway network is subdivided into various pavement segments, including branches and sections. In accordance with ASTM standards, a section is defined as an area of uniform pavement exhibiting similar design, construction date, functionality, pavement type, and traffic characteristics. Several branches, or roadways, in the City of Des Plaines network required division into multiple sections due to observation of differences in condition or traffic characteristics.

Gorrondona & Associates, Inc. (G&AI) deployed the PathRunner pavement data collection systems to collect high quality pavement imagery and profile data necessary for the semi-automated PCI survey of the City of Des Plaines pavements. The PathRunner system is shown in Figure 2-2. The PathRunner was driven on all roads and alleys in scope. G&AI's PathRunner survey team collected pavement condition data, including:

- High-resolution 3D downward images for detecting cracking,
- Rutting measurements, and
- High-resolution, forward-facing, right-of-way images.

Figure 2-2: PathRunner Pavement Data Collection System

2 lane roads were surveyed in 1 direction. 3 or more lane roads were surveyed in 2 direction. All alleys were surveyed in 1 direction. 100 percent of the data collected was assessed for distresses.

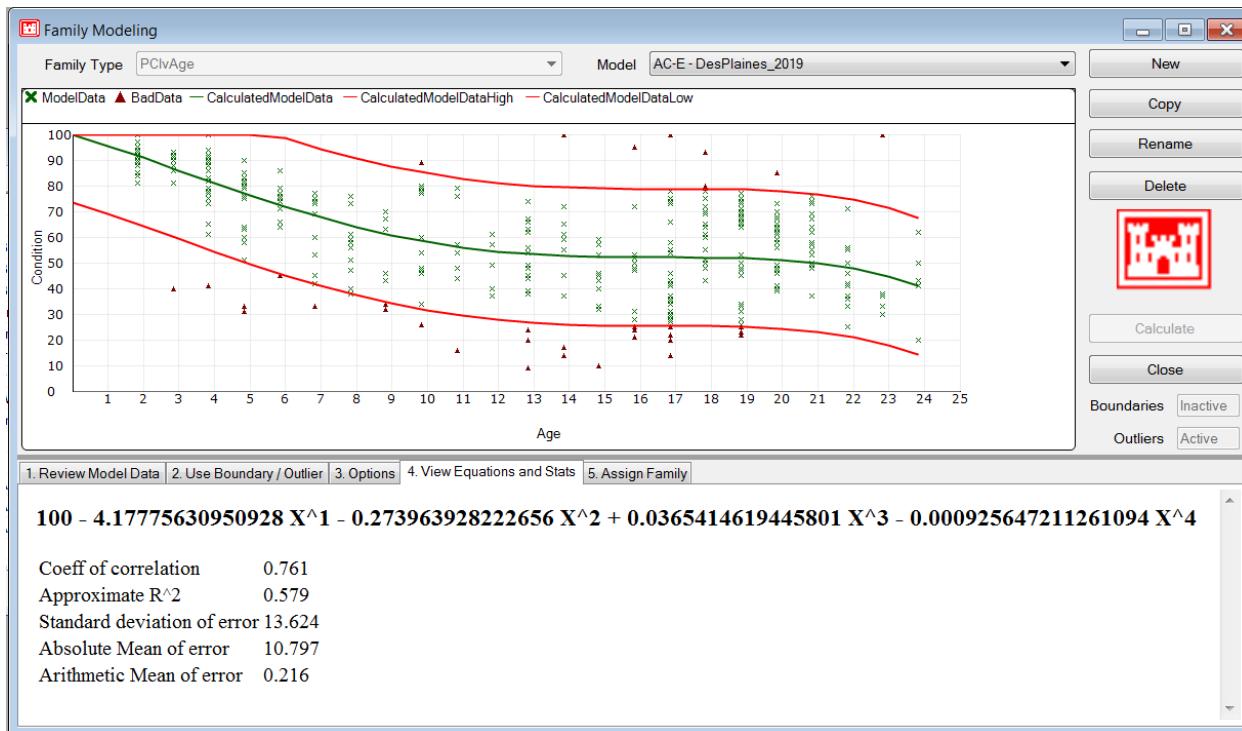

## 2.6 Pavement Performance Model

In order to predict pavement condition over time, pavement deterioration models need to be developed. Pavement condition deterioration models utilize known pavement information, such as age and PCI, as a basis to predict future deterioration trends. Deterioration models represent pavement groups that deteriorate in a similar manner and are developed to predict pavement conditions over time. The group of pavements assigned to a model is termed a "family". It is assumed that pavement deterioration within a family is similar, and as such, the PCI can be predicted at a desired future age. Pavement deterioration models were generated for each "rank" and "surface type". These models are developed in PAVER™ using the software modelling

tool. Since limited historic construction data was provided, some models had to be combined to achieve acceptable statistical confidence limits. The point at which rehabilitation should be done before the steep decline occurs is called the "critical PCI", and is generally considered to be in the PCI range of 50-70. If the work is done before deterioration accelerates, the cost of rehabilitation can be reduced significantly. Figure 2-3 shows a sample pavement deterioration model developed in PAVER™ and Table 2-5 summarizes the deterioration models and critical PCI values that were used for different PCI family groups.

In order to forecast pavement condition over the next few years, deterioration modeling plots of pavement age vs. conditions need to be input to the PAVER™ pavement management software. The deterioration curves obtained from the historical data on pavement condition are used to build models that can predict the future pavement condition accurately. To accomplish this task, construction history records obtained from the City were used to produce pavement deterioration curves for each rank and type of pavement.

**Figure 2-3: Sample Pavement Deterioration Curve Developed in PAVER**

**Table 2-5: Pavement Deterioration Rates**

PCI Family Model (Surface-Rank)	Critical PCI	Equation
AC-A&B	65	$PCI = 100 - 3.501 \times Age$
AC-C	60	$PCI = 100 - 5.609 \times Age - 0.033 \times Age^2 + 0.026 \times Age^3 - 0.001 \times Age^4$
AC-E	60	$PCI = 100 - 4.178 \times Age - 0.274 \times Age^2 + 0.036 \times Age^3 - 0.001 \times Age^4$
AC-O	55	$PCI = 100 - 1.487 \times Age$
PCC	55	$PCI = 100 - 0.663 \times Age$

## 3.0 Pavement Condition Survey - Results

### 3.1 Overview of Pavement Inventory

The City of Des Plaines includes 878 PCI survey sections comprising approximately 22 million square feet (SF). A review of the pavement inventory showed that there are over 318 lane miles of roadways and alleyways within the city limits, most of which are asphalt concrete-surfaced.

As part of the inventory verification, various attribute fields were documented such as branch name (roadway name), from-to, pavement type, length, width, and road class. These inventory items are presented for each section in Appendix A-1.

### 3.2 Overview of PCI Results

The current PCI scores for the sections within the City of Des Plaines roadway network are reported in Table A-1 of Appendix A. The table presents branch use, corresponding 7-level PCI category, and load associated impact on PCI (PCI % Load), climate associated impact on PCI (PCI % Climate), percent impact from other factors. Pavement network maps displaying current roadway conditions are also provided in Appendix B.

Table 3-1 and Figure 3-1 summarizes the pavement condition results by pavement use (Roadways vs Alleyways). From the total inspected areas 97% are roadways and 3% are alleyways. Results of the pavement condition survey indicated that the overall PCI of the City of Des Plaines is 62 (Fair).

**Table 3-1: Current Conditions (by pavement use)**

Branch Use	Area (SF)	No. Sections	Area- Weighted PCI	PCI Condition
Alleyway	654,407	101	78	Satisfactory
Roadway	21,212,626	777	61	Fair
<b>Overall</b>	<b>21,867,033</b>	<b>878</b>	<b>62</b>	<b>Fair</b>

**Figure 3-1: Current Conditions (by pavement use)**

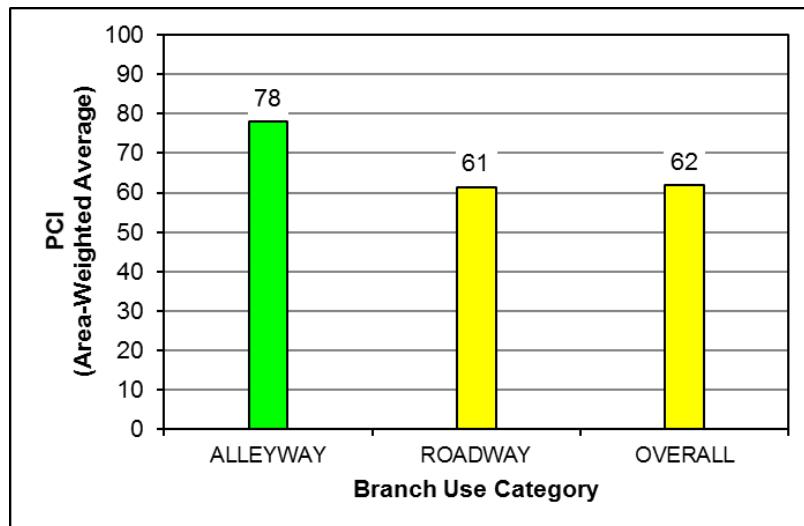

Figure 3-2 presents the breakdown of PCI categories by pavement use. The result shows that most of alleyways are in “Satisfactory” or “Good” condition as compared to roadways (78% vs 36%).

**Figure 3-2: Current Condition Breakdown (by pavement use)**

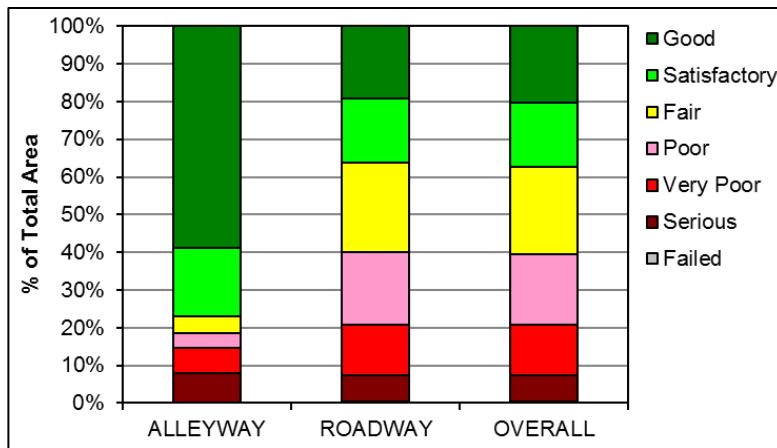

Table 3-2 and Figure 3-3 present the area weighted average PCI conditions by the pavement type, AC (Asphalt Concrete) and PCC (Portland Cement Concrete). PCC sections on average are overall in a much better condition (PCI of 93) as compared to the AC sections (PCI of 60), however note that PCC sections make up only 5% of the total network area.

**Table 3-2: Current Conditions (by pavement type)**

Pavement Type	Total Area (SF)	% of Area	Number of PCI Sections	% of PCI Sections	Area-Weighted PCI	PCI Rating
AC	20,734,460	95%	814	93%	60	Fair
PCC	1,132,573	5%	64	7%	94	Good
<b>OVERALL</b>	<b>21,867,033</b>	<b>100%</b>	<b>878</b>	<b>100%</b>	<b>62</b>	<b>Fair</b>

**Figure 3-3: Current Conditions (by pavement type)**

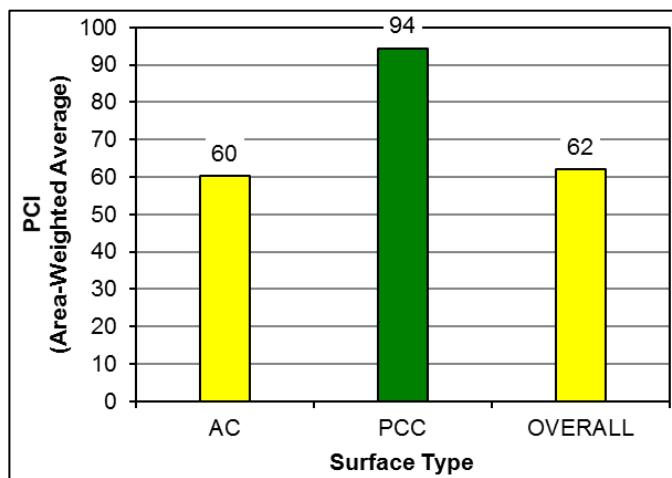

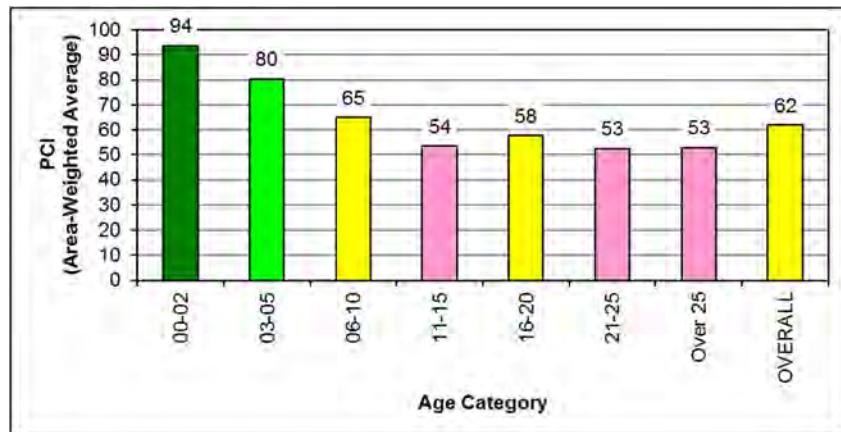

Table 3-3 and Figure 3-4 present the average area weighted PCI conditions by the pavement age. As expected, as the age of the pavement increases the pavement condition decreases.

**Table 3-3: Current Conditions (by pavement age)**

Age Category (Years)	Total Area (SF)	% of Area	Number of Sections	% Sections	Area-Weighted Age	Area-Weighted PCI	PCI Rating
0-2	1,608,308	7%	55	6.3%	2	94	Good
3-5	3,001,154	14%	95	10.8%	4	80	Satisfactory
6-10	2,136,803	10%	87	9.9%	8	65	Fair
11-15	2,614,924	12%	107	12.2%	13	54	Poor
16-20	4,685,642	21%	182	20.7%	18	58	Fair
21-25	1,303,822	6%	47	5.4%	22	53	Poor
Over 25	6,516,380	30%	305	34.7%	119	53	Poor
<b>OVERALL</b>	<b>21,867,033</b>	<b>100%</b>	<b>878</b>	<b>100%</b>	<b>44</b>	<b>62</b>	<b>Fair</b>

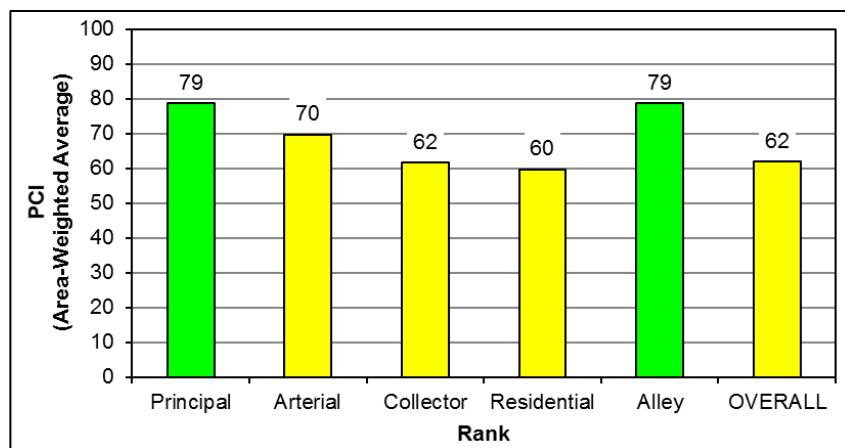

**Figure 3-4: Current Condition (by pavement age)**

Note: Sections under the Over 25 category correspond to sections with no work history record, therefore the age category doesn't represent actual value.

Table 3-4 and Figure 3-5 present the average PCI conditions by the pavement function rank. Overall alleys show the highest overall condition value. With respect to roadways, principal and arterial roadways were observed to be in better condition than other pavement ranks.

**Table 3-4: Current Conditions (by pavement functional rank)**

Functional Rank	Total Area (SF)	% of Area	Number of PCI Sections	% of PCI Sections	Area-Weighted PCI	PCI Rating
Principal	733,993	3.4%	13	1.5%	79	Satisfactory
Arterial	1,505,062	6.9%	23	2.6%	70	Fair
Collector	3,926,130	18.0%	119	13.6%	62	Fair
Residential	15,064,887	68.9%	626	71.3%	60	Fair
Alley	636,961	2.9%	97	11.0%	79	Satisfactory
<b>OVERALL</b>	<b>21,867,033</b>	<b>100%</b>	<b>878</b>	<b>100%</b>	<b>62</b>	<b>Fair</b>

**Figure 3-5: Current Condition Breakdown (by functional rank)**

### 3.3 Examples of PCI Conditions

Examples of various PCI category levels are shown in Figures 3-6 to 3-16. The PCI category along with the PCI score are provided in each of the figures.

**Figure 3-6: Cedar Street Section 05, PCI 100 (Good)**

## 4.0 Maintenance and Rehabilitation Budget Analysis

Maintenance and repair (M&R) requirements were performed in PAVER™ at various annual funding levels or by specifying a target PCI. This chapter presents the Unit Costs development, M&R policies, and results of various budget scenarios.

### 4.1 Unit Cost Development

Before developing the capital improvement repair plan, different budget scenarios were developed in PAVER™. These scenarios are based on the concept that each pavement section will be repaired at a unit cost specific to its condition rating. This allows for rapid evaluation of different scenarios at a high budget level. Table 4-1 and Table 4-2 provide the localized and major unit costs used in the budget scenarios presented in this report. Material and labor unit costs were mostly obtained through the bid document provided by the City.

*It is important to note that the unit costs developed and used in subsequent analysis, are intended for network-level decision making, cost estimation, and budget planning purposes. It is not intended to substitute project level evaluation and cost estimation.*

**Table 4-1: Localized Maintenance and Repair Activities**

Work	Cost	Units
Crack Sealing - AC	\$0.60	Cost/FT
Crack Sealing - PCC	\$0.60	Cost/FT
Grinding (Localized)	\$2.00	Cost/FT
Joint Seal (Localized)	\$0.52	Cost/FT
Patching - AC Deep	\$6.48	Cost/SF
Patching - AC Shallow	\$4.53	Cost/SF
Patching - PCC Full Depth	\$7.92	Cost/SF
Patching - PCC Partial Depth	\$7.14	Cost/SF
Shoulder leveling	\$0.56	Cost/FT
Slab Replacement - PCC	\$7.92	Cost/SF

**Table 4-2: Major Maintenance and Repair Activities**

Major Work	Unit Cost/SF	Unit Cost/FT	Notes
Road - Complete Reconstruction - PCC	\$27.99	\$699.80	Includes Curb, Sidewalk, Driveways, Storm Sewer repairs.
Road - Complete Reconstruction - AC	\$20.26	\$506.50	Includes Curb, Sidewalk, Driveways, Storm Sewer repairs.
Alley - Complete Reconstruction - PCC	\$18.15	\$453.69	Includes Driveway, ADA Ramps, and Curb repair.
Alley - Complete Reconstruction - AC	\$8.48	\$212.00	Includes Driveway, ADA Ramps, and Curb repair.
6 in Variable Mill & Overlay	\$16.00	\$400.00	Includes Driveway, ADA Ramps, and Curb maintenance.
3 in Variable Mill & Overlay	\$8.00	\$200.00	Includes Driveway, ADA Ramps, and Curb repair.
3 in Variable Mill & Overlay	\$6.00	\$150.00	Includes ADA Ramp repair.
3 in Variable Mill & Overlay (PW)	\$4.00	\$100.00	No additional repair items included.

## 4.2 Localized M&R Analysis

M&R policies refer to the activities that are applied at different condition levels to repair a pavement section. Localized maintenance policies are meant to identify ongoing, routine maintenance of individual pavement sections as defined in the PMP. The preventive maintenance policy is aimed at slowing the rate of deterioration through consistent maintenance of existing pavements and is generally applied to pavements in satisfactory or good condition and have minimal structural defect. However, in instances where funds are unavailable, it can be applied to pavements that are in fair or worse condition keep the pavement in safe and operational condition. These policies and costs are most reliable if applied immediately after a PCI survey is conducted as they are based on the distresses identified during the survey. These policies cannot be applied to subsequent years because future pavement distress types, severity and quantity cannot be reliably predicted. The policies are listed in Table 4-3.

**Table 4-3: Localized Maintenance Policies**

Distress	Low	Medium	High
<b>Asphalt Concrete Localized Maintenance Policies</b>			
Alligator Cracking	Crack Sealing - AC	Patching - AC Deep	Patching - AC Deep
Bleeding			Patching - AC Shallow
Block Cracking		Crack Sealing - AC	Patching - AC Shallow
Bumps/Sags		Grinding (Localized)	Patching - AC Shallow
Corrugation		Grinding (Localized)	Patching - AC Shallow
Depression		Patching - AC Deep	Patching - AC Deep
Edge Cracking		Crack Sealing - AC	Patching - AC Deep
Joint Reflective Cracking		Crack Sealing - AC	Patching - AC Deep
Lane Shoulder Drop-Off		Shoulder Leveling	Shoulder Leveling
Longitudinal & Transverse Cracking		Crack Sealing - AC	Patching - AC Shallow
Patching			Patching - AC Deep
Pothole	Patching - AC Deep	Patching - AC Deep	Patching - AC Deep
Railroad Crossing		Patching - AC Shallow	Patching - AC Deep
Rutting		Patching - AC Deep	Patching - AC Deep
Shoving		Patching - AC Deep	Patching - AC Deep
Slippage Cracking		Patching - AC Shallow	Patching - AC Shallow
Swelling		Grinding (Localized)	Patching - AC Shallow
Raveling		Patching - AC Shallow	Patching - AC Shallow
<b>Portland Cement Concrete Localized Maintenance Policies</b>			
Blow Up	Patching - PCC Partial Depth	Patching - PCC Full Depth	Slab Replacement - PCC
Corner Break	Crack Sealing - PCC	Patching - PCC Full Depth	Patching - PCC Full Depth
Divided Slab	Slab Replacement - PCC	Slab Replacement - PCC	Slab Replacement - PCC
Durability Cracking	Crack Sealing - PCC	Patching - PCC Partial Depth	Slab Replacement - PCC
Faulting		Grinding (Localized)	Patching - PCC Full Depth
Joint Seal Damage		Joint Seal (Localized)	Joint Seal (Localized)

Distress	Low	Medium	High
Lane Shoulder Drop-Off		Shoulder Leveling	Shoulder Leveling
Linear Cracking		Crack Sealing - PCC	Patching - PCC Partial Depth
Large Patch		Crack Sealing - PCC	Patching - PCC Full Depth
Small Patch		Crack Sealing - PCC	Patching - PCC Full Depth
Pumping	Joint Seal (Localized)		
Punchout	Crack Sealing - PCC	Patching - PCC Full Depth	Slab Replacement - PCC
Scaling		Grinding (Localized)	Grinding (Localized)
Corner Spall	Crack Sealing - PCC	Patching - PCC Partial Depth	Patching - PCC Partial Depth
Joint Spall	Crack Sealing - PCC	Patching - PCC Partial Depth	Patching - PCC Partial Depth

The above listed policies were applied to the distress data recorded in the 2019 inspection. Table 4-4 shows the summary costs required for localized maintenance by work type. The total localized maintenance cost is approximately \$800K. Summary estimated work quantities are shown in Table 4-4 based on extrapolated distresses. Detailed list of localized maintained requirement is shown in appendix Table A-2 and Map B-8 to B-10.

**Note:** If major work is planned for any section within the next two (2) years, localized work can be deferred on those sections.

**Table 4-4: Estimated Near Term Localized Maintenance Plan Cost**

Work Description	Work Cost	Estimated Work Quantity	Work Quantity Units
Crack Sealing - AC	\$77,038	128,397	FT
Crack Sealing - PCC	\$542	903	FT
Joint Seal (Localized)	\$44,810	86,175	FT
Patching - AC Deep	\$513,153	79,190	SF
Patching - AC Shallow	\$130,406	28,787	SF
Patching - PCC Full Depth	\$5,166	652	SF
Patching - PCC Partial Depth	\$4,652	652	SF
Slab Replacement - PCC	\$24,241	3,061	SF
<b>Total:</b>	<b>\$800,007</b>		

### 4.3 Major M&R Budget Analysis

This section presents the Major M&R work (rehabilitation and reconstruction) requirements to establish a pavement capital improvement program. The objective of the work program is to estimate the future 5-year Major M&R funding need. Table 4-5 shows the policies applied for major M&R work activity recommendations. Budget analyses were performed with a start date of January 1, 2020. A 3 percent inflation factor is applied to the unit costs for every year after 2020.

**Table 4-5: Major M&R Policies**

PCI Range	Work Category
0-30	Reconstruction
31-70	Rehabilitation (Percent Slab Replacement or Mill-and-Overlay)
71-100	Localized Maintenance

The budget scenarios discussed in this report are represented as follows:

1. **Eliminate Backlog:** This scenario eliminates all repair requirements and addresses all sections requiring major repair within the 5 years period which results in a projected PCI of 85 (Satisfactory) by 2024 at an annual funded cost of approximately \$39M and unfunded backlog cost of \$0.
2. **\$15M per Year:** This scenario evaluates the effect of \$15M/YR funding level which results in a projected PCI of 66 (Fair) by 2024 and an unfunded backlog cost of approximately \$140M.
3. **\$12.5M per Year:** This scenario evaluates the effect of \$12.5M/YR funding level which results in a projected PCI of 63 (Fair) by 2024 and an unfunded backlog cost of approximately \$159M.
4. **\$3M in Year 1 and \$15M per Year for Years 2-5:** This scenario evaluates the effect of spending \$3M for the first year and \$15M/YR for years 2 to 5 which results in a projected PCI of 63 (Fair) by 2024 and an unfunded backlog cost of approximately \$162M.
5. **\$10M per Year:** This scenario evaluates the effect of \$10M/YR funding level which results in a projected PCI of 59 (Fair) by 2024 and an unfunded backlog cost of approximately \$173M.
6. **\$7.5M per Year:** This scenario evaluates the effect of \$7.5M/YR funding level which results in a projected PCI of 57 (Fair) by 2024 and an unfunded backlog cost of approximately \$187M.
7. **\$5M per Year:** This scenario evaluates the effect of \$5M/YR funding level which results in a projected PCI of 55 (Poor) by 2024 and an unfunded backlog cost of approximately \$201M.
8. **\$No Work:** This scenario evaluates the effect of spending no money which results in a projected PCI of 49 (Poor) by 2024 and an unfunded backlog cost of approximately \$235M.

Details of all budget scenarios explained above are shown in Table 4-6.

**Table 4-6: Forecasted Pavement Major M&R Costs for 5-Years**

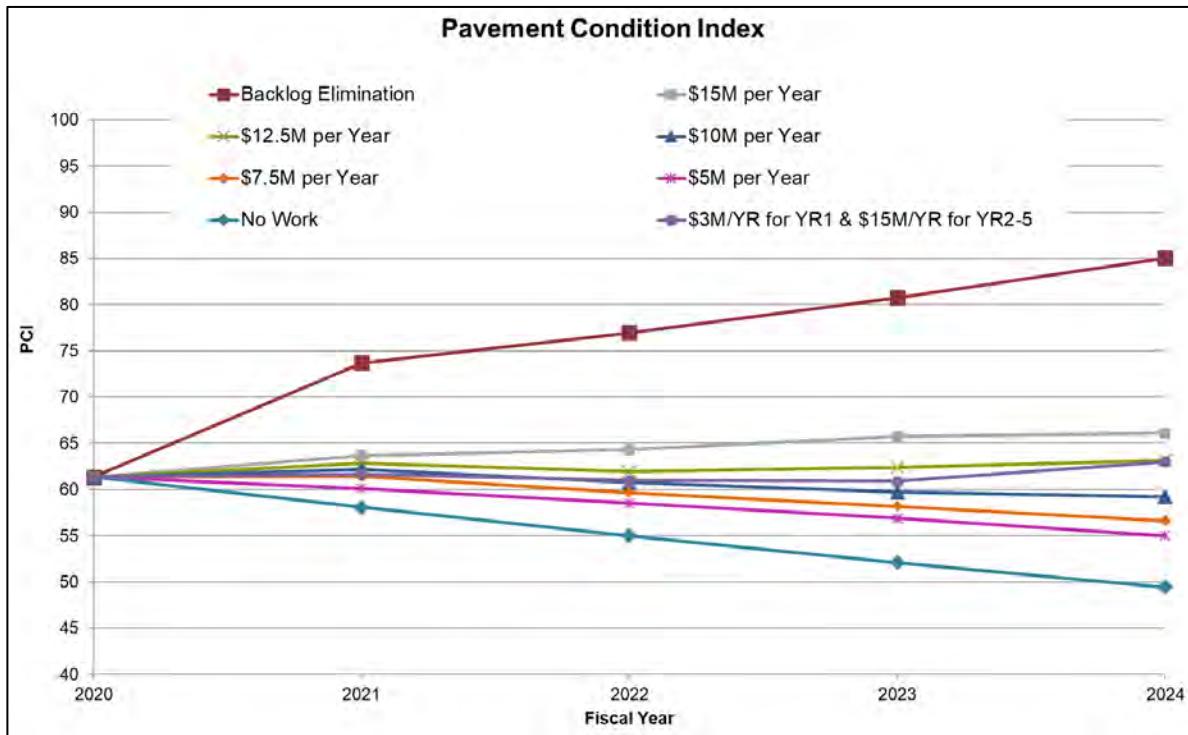

Budget Scenario	5-Year Funded Cost	5-Year Unfunded Cost	5-Year Total Cost (Funded+Unfunded)	Projected PCI (FY 2024)
Backlog Elimination	\$194,559,175	\$0	\$194,559,175	85
\$15M per Year	\$74,974,679	\$140,288,251	\$215,262,930	66
\$12.5M per Year	\$62,475,260	\$159,151,050	\$221,626,310	63
\$3M for Year 1 and \$15M/year for Years 2-5	\$62,988,740	\$162,111,247	\$225,099,986	63
\$10M per Year	\$49,984,151	\$172,768,548	\$222,752,698	59
\$7.5M per Year	\$37,483,503	\$186,758,264	\$224,241,766	57
\$5M per Year	\$24,977,423	\$201,546,226	\$226,523,649	55
No Work	\$0	\$234,758,376	\$234,758,376	49

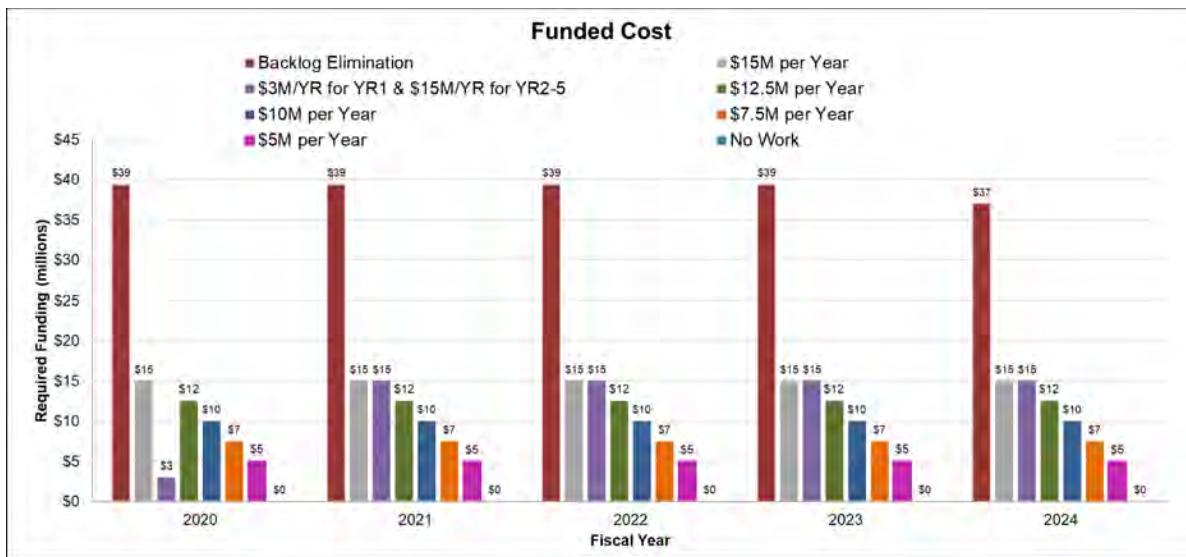

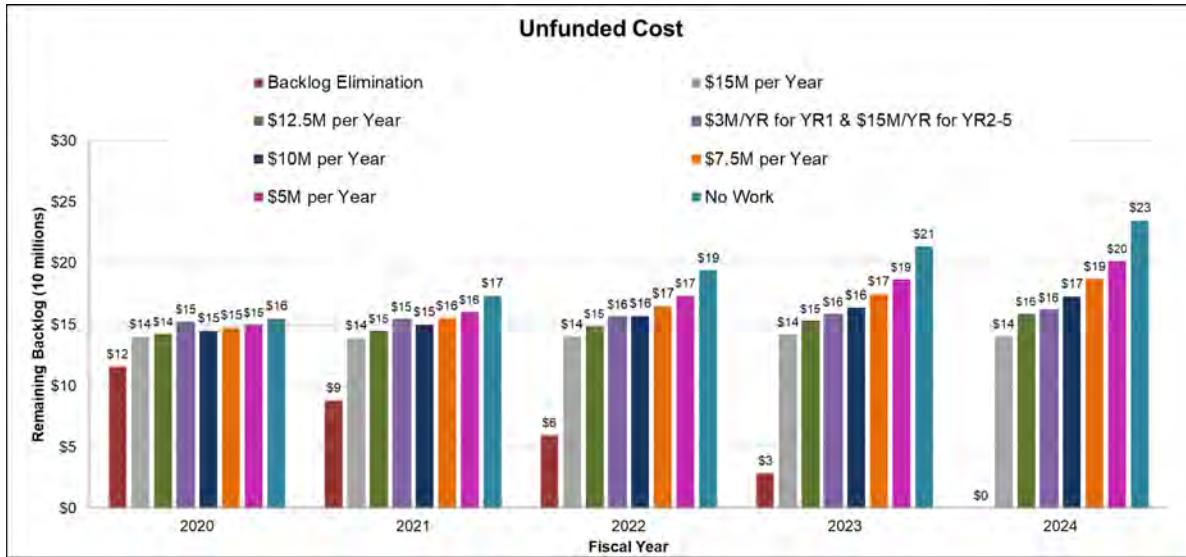

Note: The current overall PCI is 62.

## 4.4 Budget Scenarios Comparisons

Figures 4-1 to 4-3 graphically present the budget analysis scenarios. Figure 4-1 illustrates the estimated five-year change in pavement condition resulting from the budget scenarios analyzed. Budget scenarios that indicate an upward trend in pavement condition show improvement in condition over the analysis period. The overall network PCI is recommended to be in the range of 65-75. Figure 4-2 and Figure 4-3 show the annual funded and unfunded cost (backlog). The City should aim to maintain its pavements within the recommended range, to avoid more costly repairs down the line, as well as reducing their unfunded backlog over time by providing sufficient funding for pavement repair and using the funds cost effectively on appropriate treatments.

**Figure 4-1: Capital Budget Analysis – Pavement Condition**

**Figure 4-2: Capital Budget Analysis – Annual Funding****Figure 4-3: Capital Budget Analysis – Annual Unfunded/Backlog Cost**

## 4.5 Summary

Budget analysis at various levels of funding over a 5-year period were analyzed and presented. To avoid increase in backlog over the analysis period an annual funding of at least \$15M/YR is required. An annual funding level of \$12.5M/YR stabilizes the current PCI at 63, however, the backlog cost shows a gradual increase over time. The 'ideal' scenario is identified to be the backlog elimination scenario. The City's current funding scenario is to spend \$3M for the first year and to spend ~\$15M/YR for years two (2) to five (5) which also results in a PCI of 63 and a gradual increase in backlog.

Results from the localized maintenance plan indicate an estimated spend of \$800K on maintenance work over 1-2 years. The implementation of an annual maintenance program with a fixed budget for crack sealing, patching, joint seal, etc. is recommended to preserve the pavements in good condition and slow their deterioration rates. In addition, crack sealing of construction joints soon after paving is recommended to prevent the entry of water or moisture.

## 5.0 Five-Year Capital Improvement Plan

The PAVER™ budget analysis output is used as the basis for developing the capital improvement plan. Based on the inputs, and defined objectives, PAVER™ recommends a plan for the analysis period. AECOM reviewed work type recommended and practical implications of constructability and operational logistics and finalized the CIP plan.

Table 5-1 and Table 5-2 present summary 5-Year CIP recommendations by year and by rank which total \$61M. A more detailed breakdown of major M&R work by network, branch, section, type of M&R, and costs, are presented in Appendix Table A-3 and Map B-7.

**Table 5-1: Estimated CIP Cost by Year and Work Type**

Year	Work Type			Total Funding Cost	CIP Lane Miles
	Mill-and-Overlay Cost	Complete Reconstruction Cost	Selective Slab Replacement Cost		
2020	\$3,014,284	\$0	\$0	\$3,014,284	8
2021	\$13,093,756	\$1,088,813	\$6,777	\$14,589,122	36
2022	\$11,246,976	\$3,431,841	\$0	\$14,678,817	33
2023	\$12,636,520	\$2,066,759	\$10,652	\$14,713,931	21
2024	\$2,830,620	\$11,801,599	\$0	\$14,632,219	13
<b>Total</b>	<b>\$42,822,156</b>	<b>\$18,389,012</b>	<b>\$17,429</b>	<b>\$61,228,597</b>	<b>111</b>

**Table 5-2: CIP Cost by Functional Rank**

Functional Rank	CIP Cost	CIP Lane Miles
Principal	\$923,832	8
Arterial	\$3,687,424	36
Collector	\$10,390,401	33
Residential	\$45,512,754	21
Alley	\$714,185	13
<b>Total</b>	<b>\$61,228,597</b>	<b>\$111</b>

### 5.1 Summary

A total funding of approximately \$61M is recommended over 5-years which results in repair work on approximately 98 lane miles of roadways and 13 lane miles of alleys. The majority of the CIP funding is spent on mill and overlay (70% of total cost) work activity to maximize the repair area and perform cost-effective treatments in a timely manner.

The CIP cost estimates and work type recommendations are network-level and should not be substituted for project level analysis work. Prior to performing any major work activity, coring or other similar tests are suggested to determine the appropriate work type and required pavement thickness.
